

Abstract

Wireless Insurance Verification System

This invention is intended to be used by Police Departments, in those states with mandatory liability insurance laws, as a way to enforce compliance by those that ignore to insure their automobiles. We've taken advantage of the boom in wireless cell phones and the internet. We install a wireless PC card into the laptop computer located inside of a police cruiser. Then we install internet radios in the scanners and configure them with our software. Using our software package, we link together insurance companies and inspection stations. The insurance companies load information about the policy and the inspection stations apply a state issued, pre-embossed barcode sticker on the inside of the front windshield. After the sticker is in place it can be scanned so that the officer knows if there is a policy in effect at the time of the scan. The officer isn't confined to the inside of his car; he's on the side of the road scanning for compliance.
